

# ALYPSO™ PLUS

## WATER CONDITIONER

Physical barriers and poor water quality require surfactants and water conditioners to enhance water infiltration and condition water.

Alypso™ Plus speeds up the infiltration of irrigation water through thatch and into hard-to-wet soils with the added benefits of a water conditioner.

Alypso Plus is a unique, naturally-derived concentrated organic acid.

### FEATURES AND BENEFITS:

- Faster water infiltration – decreased run-off or standing water and firmer playing surfaces
- Uniform soil wetting – maximum availability of nutrients and uniform placement of soil-active products
- Reduced water pH – improved performance of pH-sensitive products
- Injected or sprayed – versatile use
- Convenient – easy to pour, mix and store

### USE RATES

- Injection – 1 quart per acre
- Spray - .75 to 1 ounce per 1,000 square feet

### PACKAGING

- 2 x 2.5 gallons per case
- 20 gallon drum
- 55 gallon drum

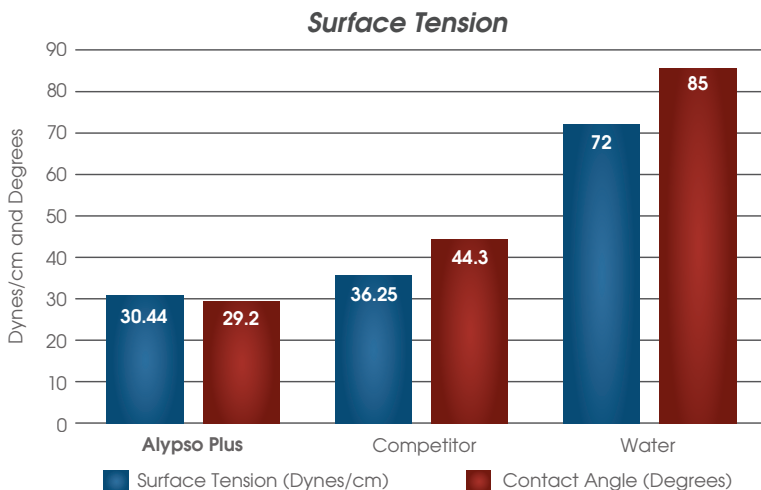

# ALYPSO™ PLUS

## 2014 PERFORMANCE DATA

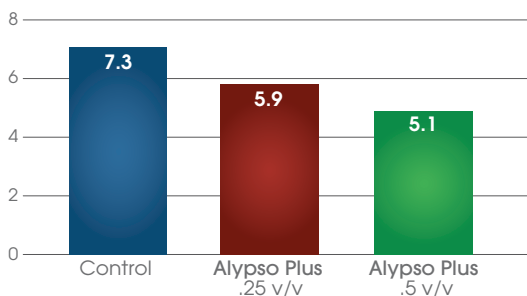

### SURFACE TENSION REDUCTION

Surface tension (dynes/cm) and contact angle (degrees) are standardized tests that determine the ability of a surfactant to reduce the surface tension between water and a solid, such as soil. In both cases, a lower value indicates higher surfactant performance.

Tests comparing Alypso Plus to water and a competitor indicate Alypso Plus reduces surface tension better than water alone or a leading infiltration surfactant.

### pH

### Bicarbonates

### WATER CONDITIONING

A water analysis\* shows a pH reduction when Alypso Plus is added to water at dilutions of .25 and .5 v/v. Lowering pH reduces carbonate and bicarbonate levels.

High levels of bicarbonate can react with calcium and magnesium in solution and precipitate insoluble calcium carbonate and magnesium carbonate (lime). This reaction reduces the amount of free calcium and magnesium in soil, which allows sodium to compete for, and occupy, negatively-charged exchange sites on clay particles. This excess sodium in clay results in damaged soil structure.
